0. Brisa Group

1. The monitoring system

- Overview
- System installation
- Performance after 12 years of operation

2. The results

- FE model for assessment and validation
- Long-term performance
- Short-term performance

3. The next generation of asset management supported by SHM

4. The references

0. Brisa Group

- ❑ One of the largest tolled motorway operators in the world

Concessions in the Netherlands

- ❑ The largest transport infrastructure group in Portugal

Management of transport infrastructures (roads and railways)

- ❑ Investments in SHM

Sorraia Bridge (A13)

Lezíria Bridge (A10)

1. The monitoring system : Overview

- ❑ Permanent monitoring system (construction + operational life)
- ❑ Monitoring project (as part of the bridge project)
- ❑ $\cong 400$ sensors (10 different type of sensors)
- ❑ 3 different acquisition systems (static, dynamic, optic)
- ❑ $> 10\text{km}$ cable length
- ❑ sampling-rate up to 100 Hz
- ❑ $\cong 1\,000\,000$ records / year

1. The monitoring system : Embedded sensors

- ❑ Embedded sensors:
Strain gauges and temperature sensors

1. The monitoring system : External sensors

❑ External sensors: Accelerometers

❑ External sensors: LVDTs

1. The monitoring system : External sensors

❑ External sensors:
Accelerometers

❑ External sensors:
LVDTs

1. The monitoring system : Cables and Acquisition Nodes

☐ Cables and connections

☐ Acquisition Nodes

1. The monitoring system : Labelling

❑ Labelling: Acquisition Nodes

❑ Labelling: External sensors

1. The monitoring system : Waterproofing and sealing

❑ Waterproofing

❑ Sealing

SOUSA, H., FÉLIX, C., BENTO, J., FIGUEIRAS, J. (2011) "Design and implementation of a monitoring system applied to a long-span prestressed concrete bridge.", *Structural Concrete* 12(2): 82–93.

<http://onlinelibrary.wiley.com/doi/10.1002/suco.201000014/abstract>

1. The monitoring system : Performance after 12 years in operation

- Good condition after 9 years of operation and without signs of vandalism

External sensors

Connection boxes

Cables path

Acquisition nodes

2007

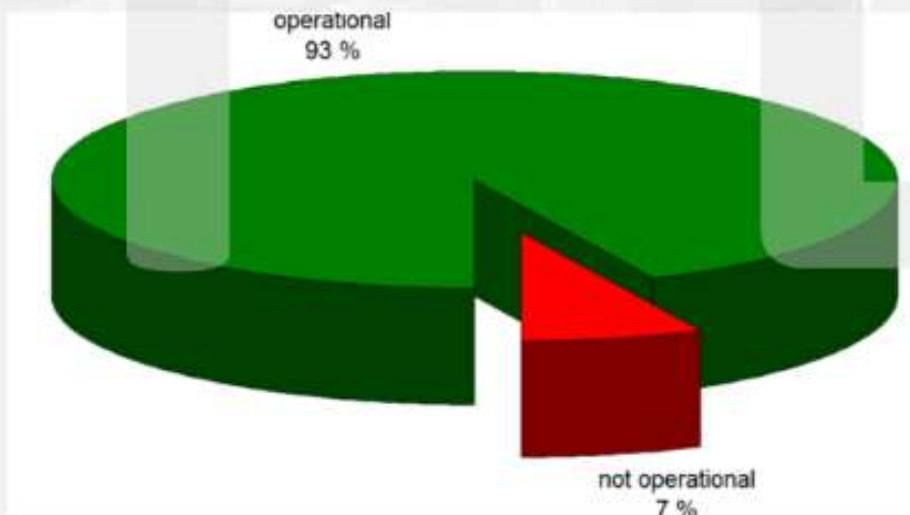

2014

1. The monitoring system : Performance after 12 years in operation

- ❑ Good condition after 9 years of operation and without signs of vandalism
- ❑ Overall, 93 % of the embedded sensors are operational, although it is being done some work to recover up to 97 %.

Current status (in 2014)

Current objective (in 2015)

1. The monitoring system : Performance after 12 years in operation

- ❑ Good condition after 9 years of operation and without signs of vandalism
- ❑ Overall, 93 % of the embedded sensors are operational, although it is being done some work to recover up to 97 %.
- ❑ Quality of the collected measurements vs. required maintenance

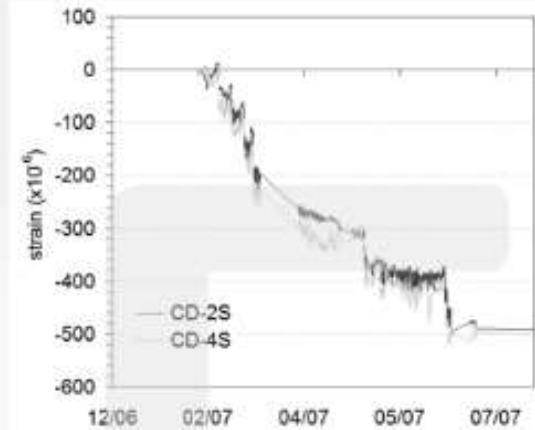

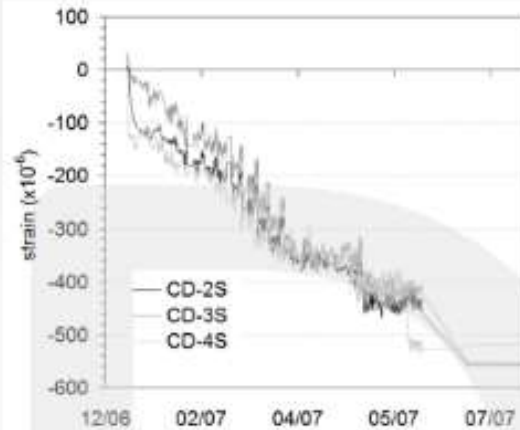

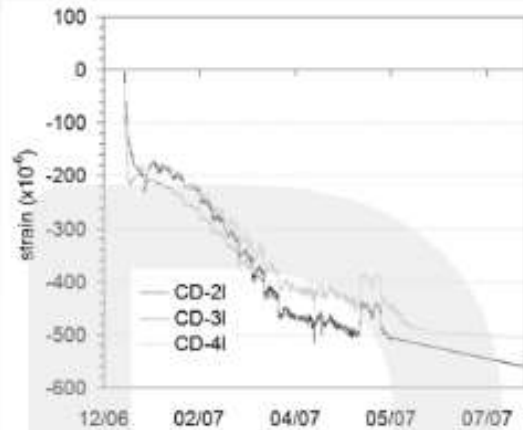

Location	Best measurement stability	Requiring particular maintenance
Embedded	<ul style="list-style-type: none">• Vibrating wire strain gauges• Pt100 thermometers• Fibre optic sensors	<ul style="list-style-type: none">• Fibre optic sensors
External	<ul style="list-style-type: none">• LVDTs• Pt100 thermometers	<ul style="list-style-type: none">• LVDTs (corrosion)• Sonar altimeters

1. The monitoring system : Measurements (since construction)

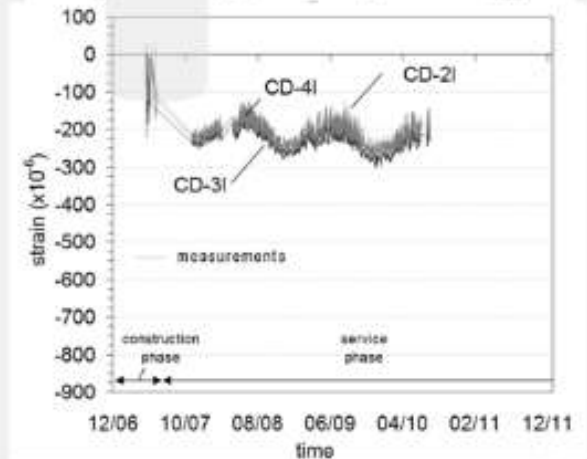

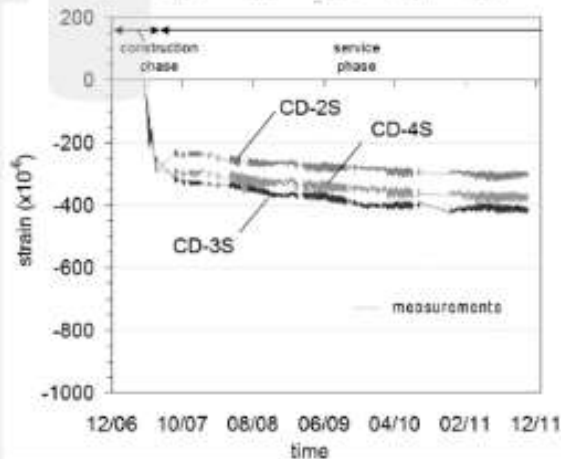

CONSTRUCTION

LOAD TEST

OPERATIONAL

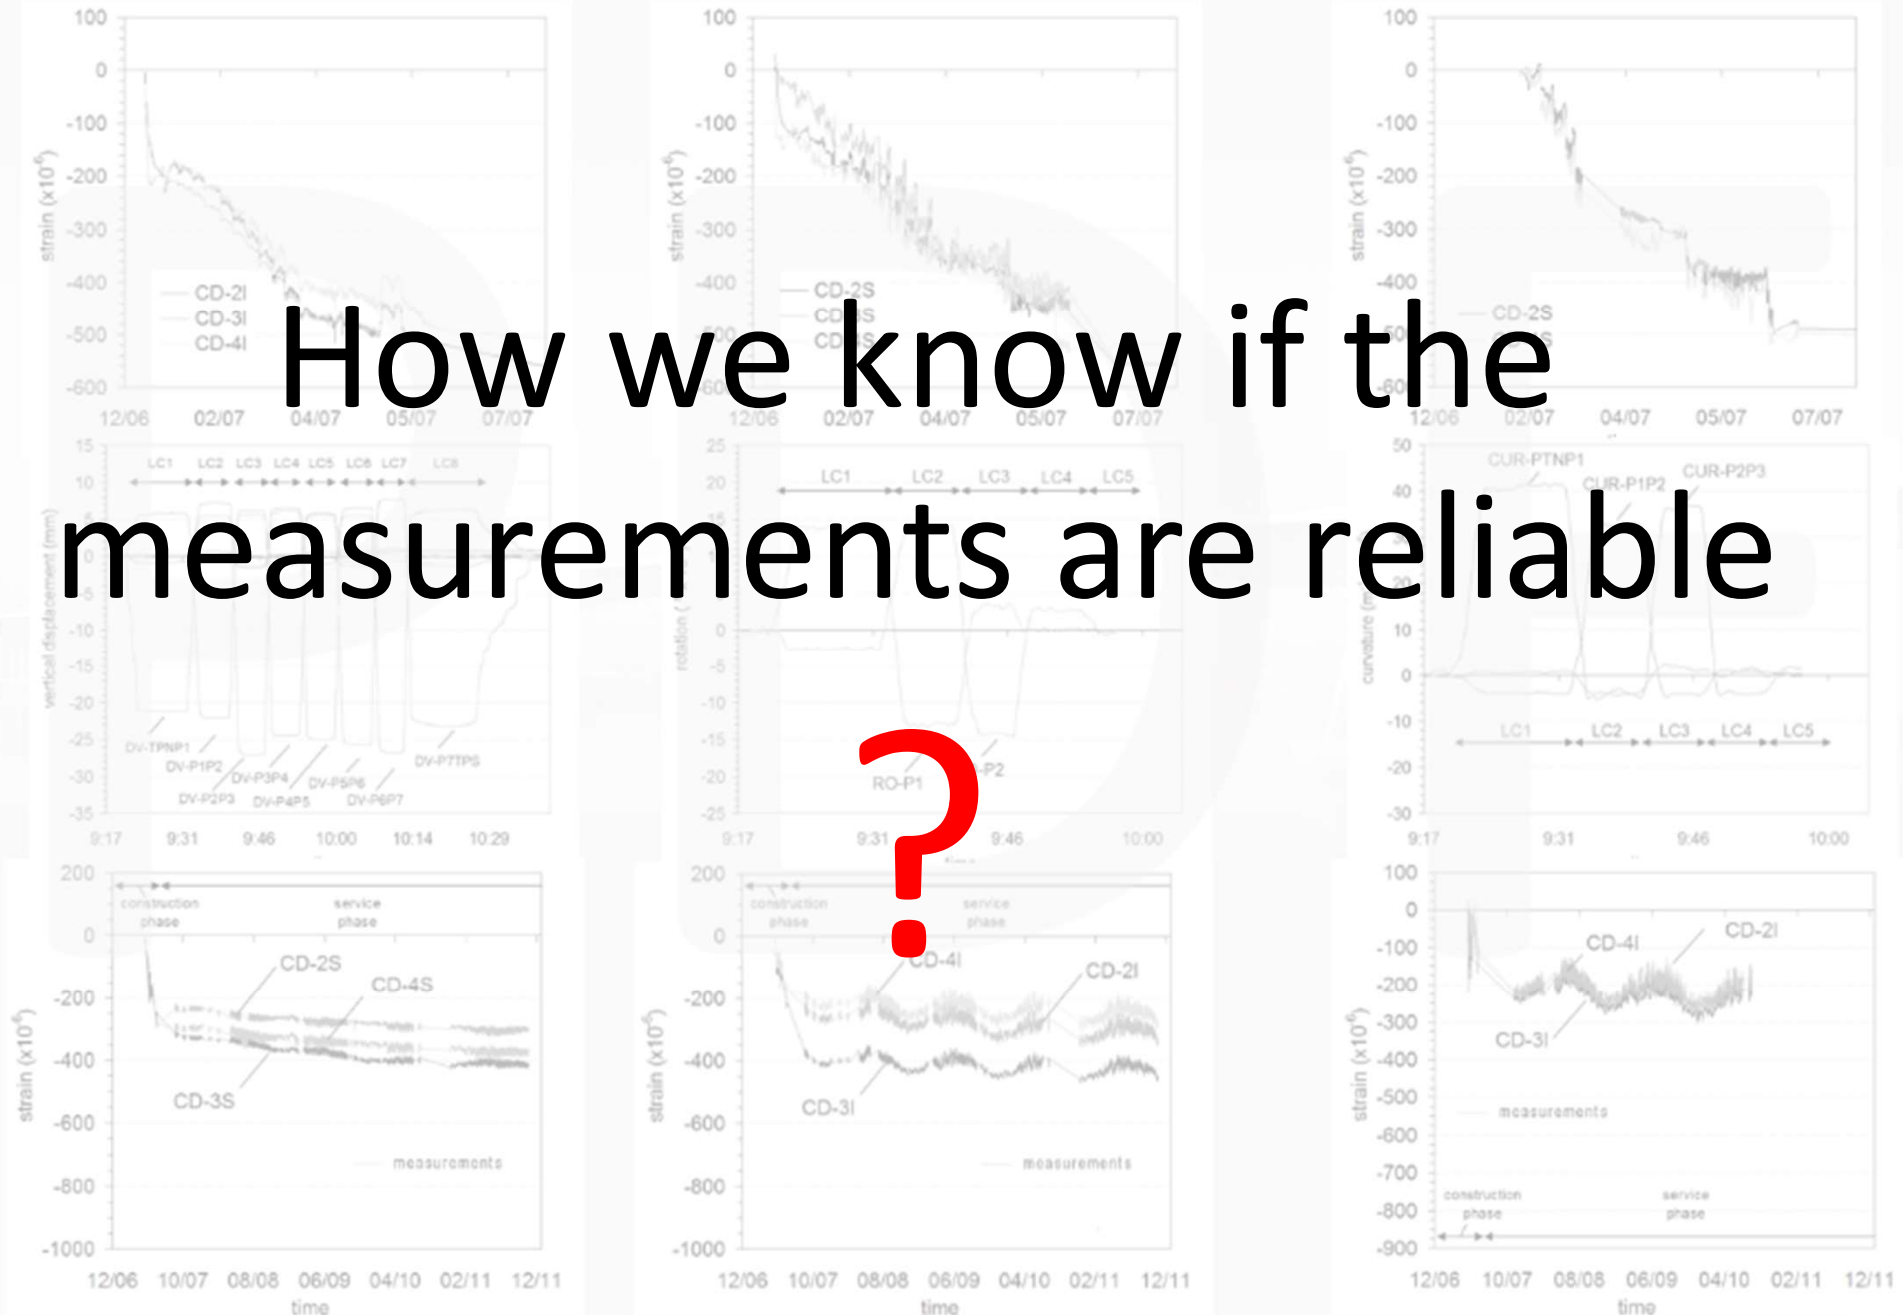

1. The monitoring system : Measurements (since construction)

CONSTRUCTION

LOAD TEST

OPERATIONAL

How we know if the measurements are reliable

2. The results : FE model for assessment and validation

iDIANA 9.3-01 : Univ. of Porto

14 APR 2011 11:39:59 deformada_temperatura_uniforme

```
Model: PT-MODEL_NEW_V4
LC1: Load case 1
Nodal DTX...G RESDTX
Max/Min on model set:
Max = .314E-2 Min = 0
Factor = .182E5
```

- Numerical simulation throughout the bridge lifetime (construction + service)
- Complexity of the construction process (geometry, materials and time-history)
- Time-dependent effects (shrinkage and creep)
- Loading: Self-weight, prestressing
- Model validation through load test at the end of the bridge construction
- Lifetime predictions based on a model updating supported by the collected measurements

SOUSA, H. A., BENTO, J., FIGUEIRAS, J. (2014) "Assessment and management of concrete bridges supported by monitoring data-based finite element modelling.", Journal of Bridge Engineering DOI:10.1061/(ASCE)BE.1943-5592.0000604

2. The results : FE model for assessment and validation

□ FE model:

- Geometry,
- Materials
- Boundaries

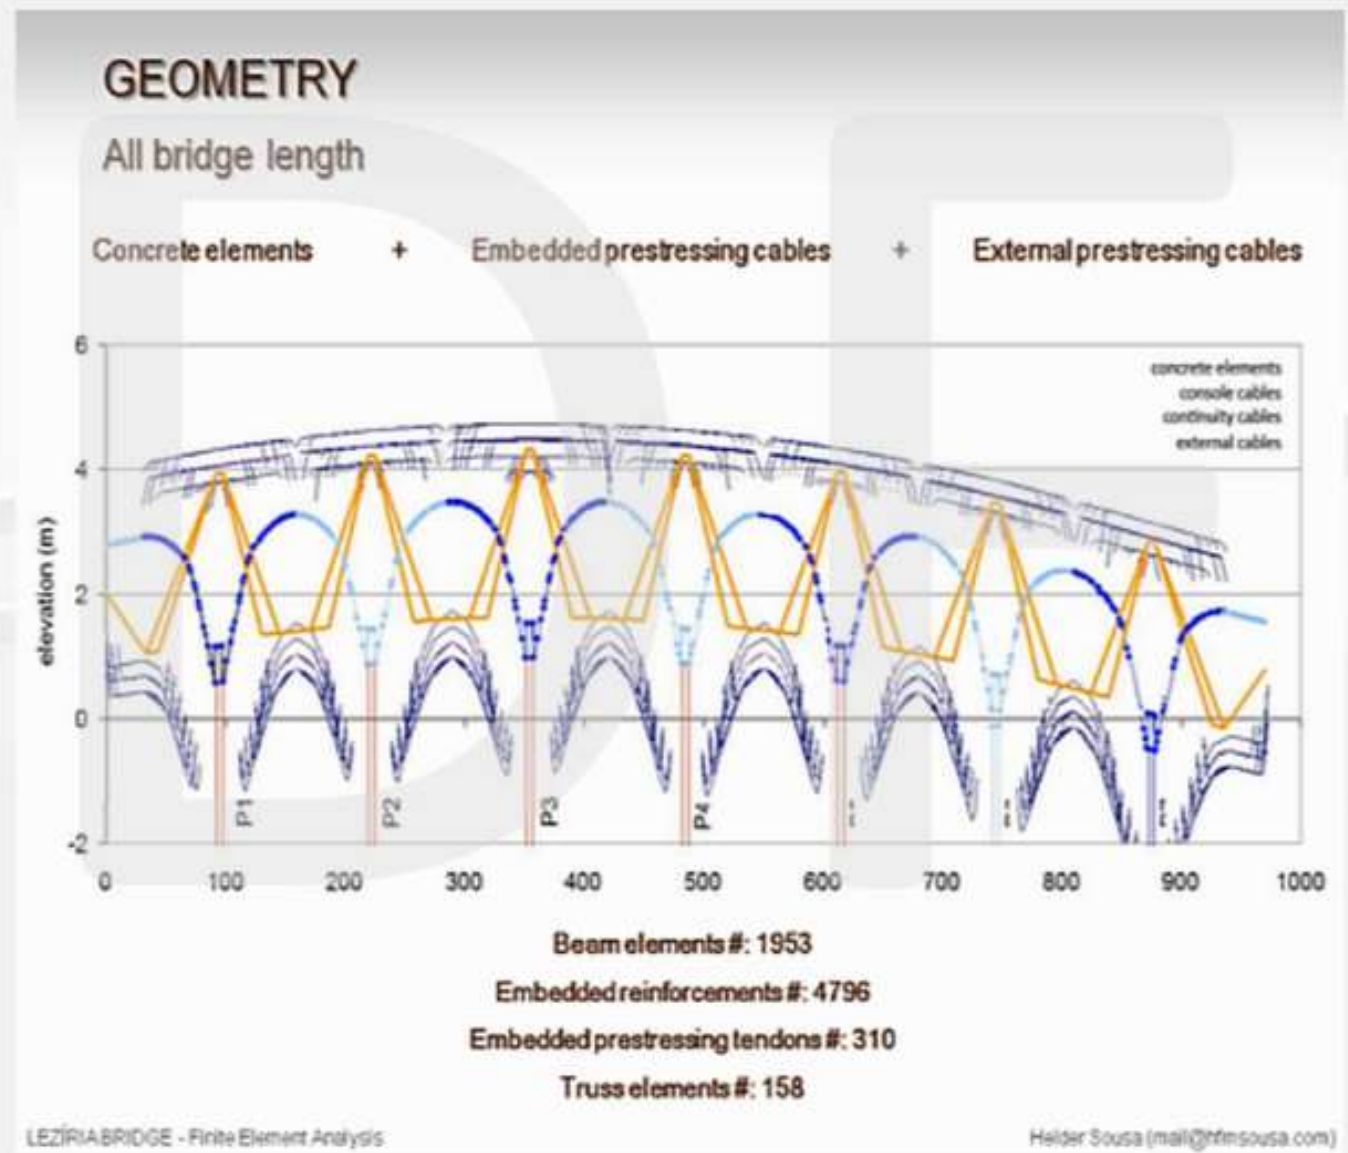

□ Loading

(construction phase and operational life):

- Self-weight
- Prestressing
- Traffic loads

□ Long-term effects:

- Shrinkage
- Creep
- Thermal effects

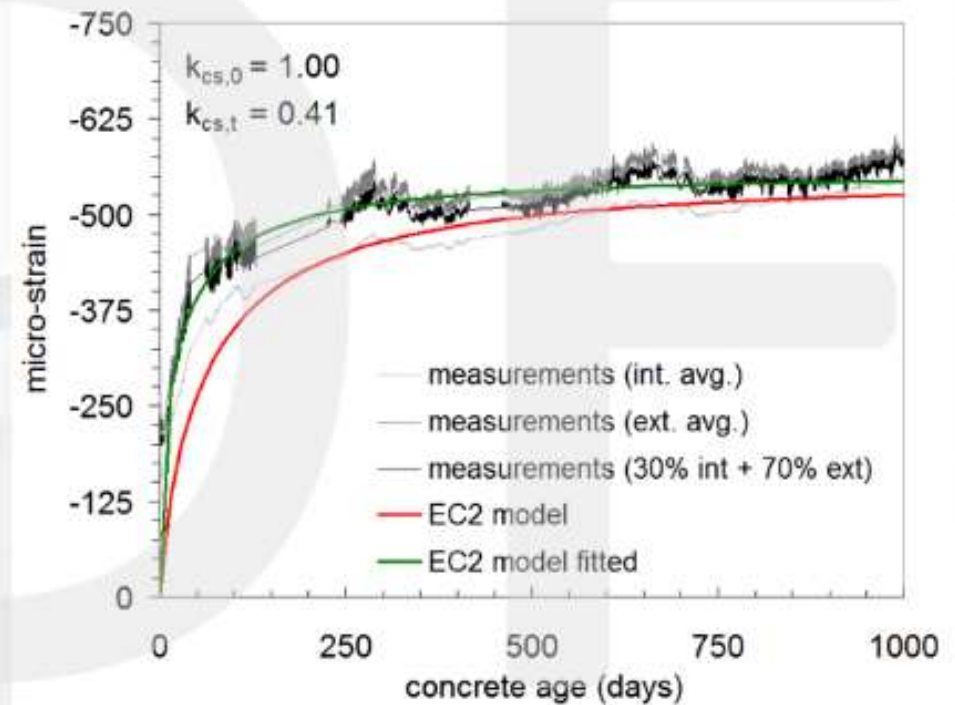

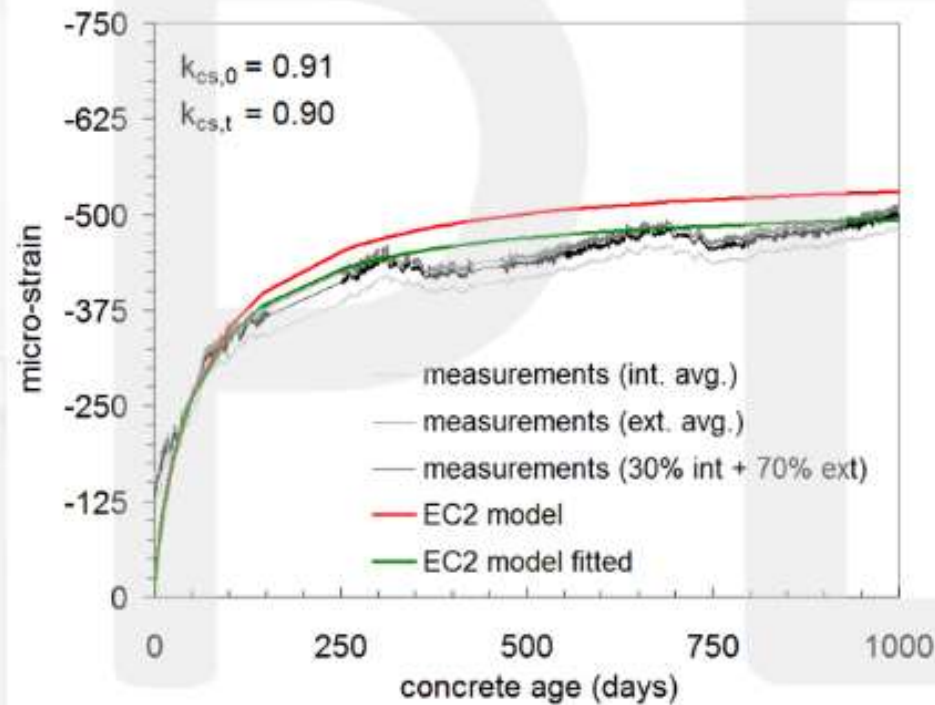

2. The results : FE model for assessment and validation

□ MATERIALS (based on measurements performed in concrete prisms)

Shrinkage (Zone A)

Shrinkage (Zone B)

2. The results : FE model for assessment and validation

□ MATERIALS (based on measurements performed in concrete prisms)

Creep

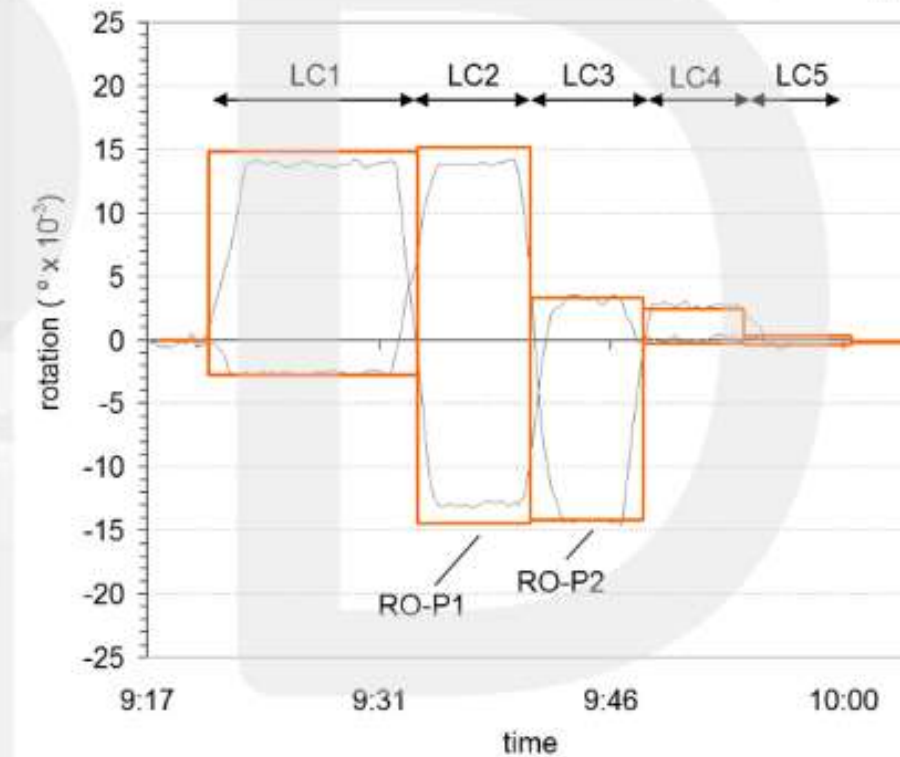

2. The results : Performance during the load test

LOAD TEST

(performed at the end of construction)

Rotations

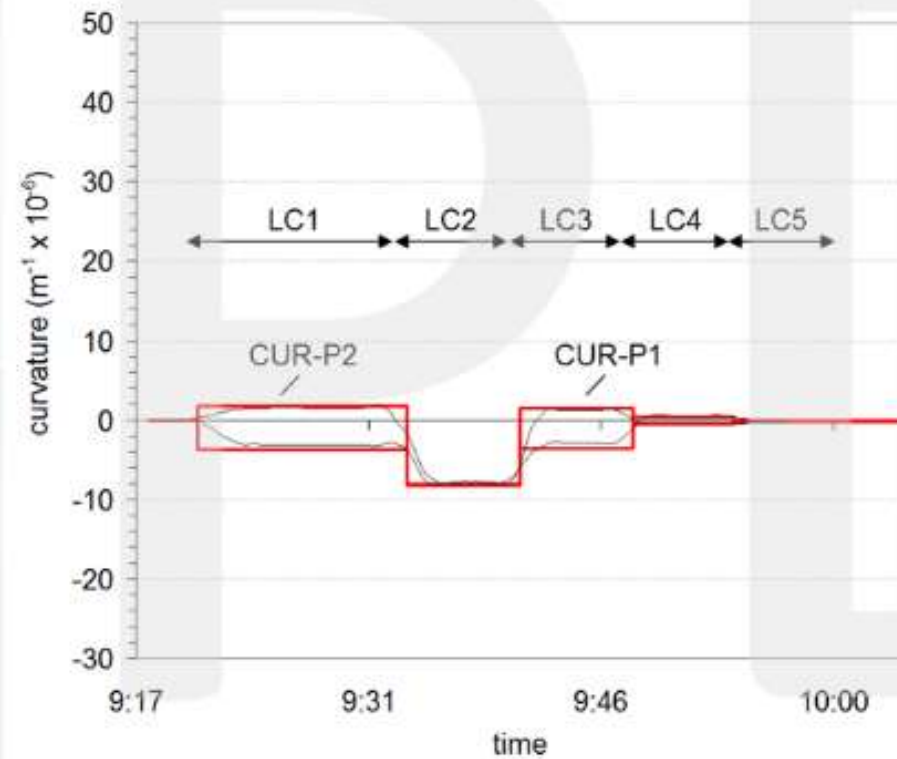

2. The results : Performance during the load test

LOAD TEST

(performed at the end of construction)

Curvatures

2. The results : Performance during the cantilever construction

Max = .314E-2 Min = 0
Factor = .182E5
```

- Numerical simulation for extreme load events, i.e. effective traffic loads crossing the bridge.
- Loads were calculated based on the strain measurements.
- Elastic behavior and cracking checked.
- Loading: Traffic loads.
- Model validation through load test at the end of the bridge construction.
- Lifetime predictions for the expected maximum deflections due to extreme loads due to traffic.

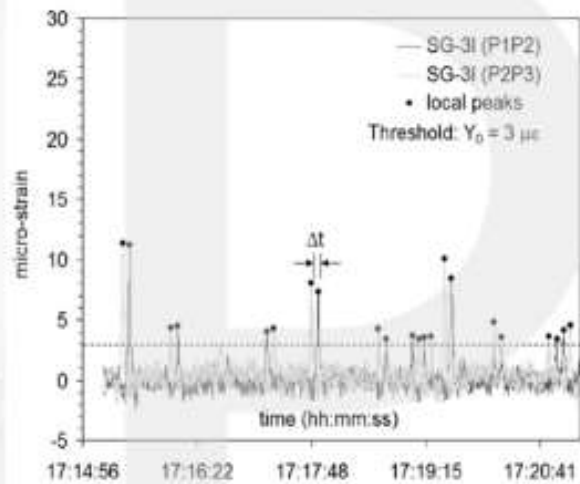

SOUSA, H., COSTA, B., HENRIQUES, A., BENTO, J., FIGUEIRAS, J. (2016) "Assessment of traffic load events and structural effects on road bridges based on strain measurements", Journal of Civil Engineering and Management DOI:10.3846/13923730.2014.897991.
<http://dx.doi.org/10.3846/13923730.2014.897991>

2. The results : Short-term performance (operational life)

EXTREME LOADS (estimation based on strain measurements)

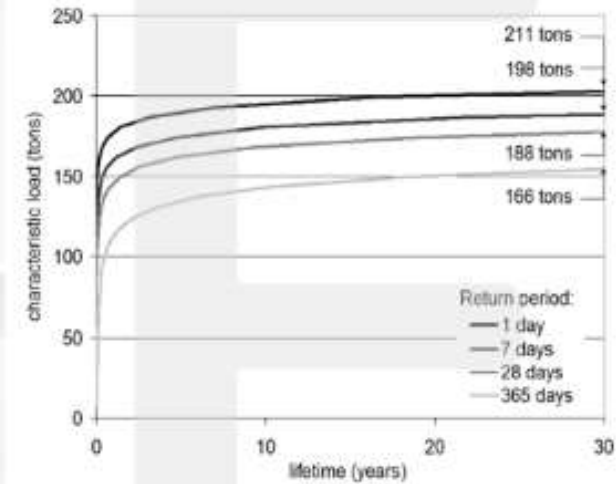

Observations

Load Histogram

Extreme Loads

$$P_i(t) = k_2(t) \cdot k_0 \cdot \varepsilon_{l,peak}(t) \quad (1)$$

$$\begin{cases} k_0 = P_{ref} / \varepsilon_{ref} & (2) \\ k_1 = \Delta l / \varepsilon_{ref} & (3) \\ k_2(t) = E_{c,ref} / E_c(t) & (4) \end{cases}$$

$$f(x) = \frac{\beta}{\delta} \left(\frac{x}{\delta} \right)^{\beta-1} \cdot e^{-\left[\left(\frac{x}{\delta} \right)^\beta \right]}$$

$$x > 0; \delta > 0; \beta > 0$$

$$\bar{f}(x) = \begin{cases} 0 & x \leq x_0 \\ \frac{f(x)}{\int_{x_0}^{\infty} f(x) dx} & x > x_0 \end{cases}$$

$$R_p(x) = \frac{\tau}{\alpha} \cdot \begin{cases} \tau - \text{observation period} \\ \alpha = 1 - F(x) \end{cases}$$

$$R_p = -\frac{T_{lifetime}}{\ln(1-\alpha)}, \quad \alpha = 0.05$$

2. The results : Short-term performance (operational life)

□ ASSESSMENT OF THE BRIDGE BEHAVIOR

Safety level for the Serviceability Limit States

Return period	Characteristic load (tons)	Vertical displacement (mm)		Safety level
		Project	Predicted	
1 day	211	55*	44.8	1.23
7 days	198		43.9	1.25
28 days	188		43.1	1.27
365 days	166		41.7	1.32

* Value determined for the characteristic combination of actions, with a lower limit of $L/1200$.

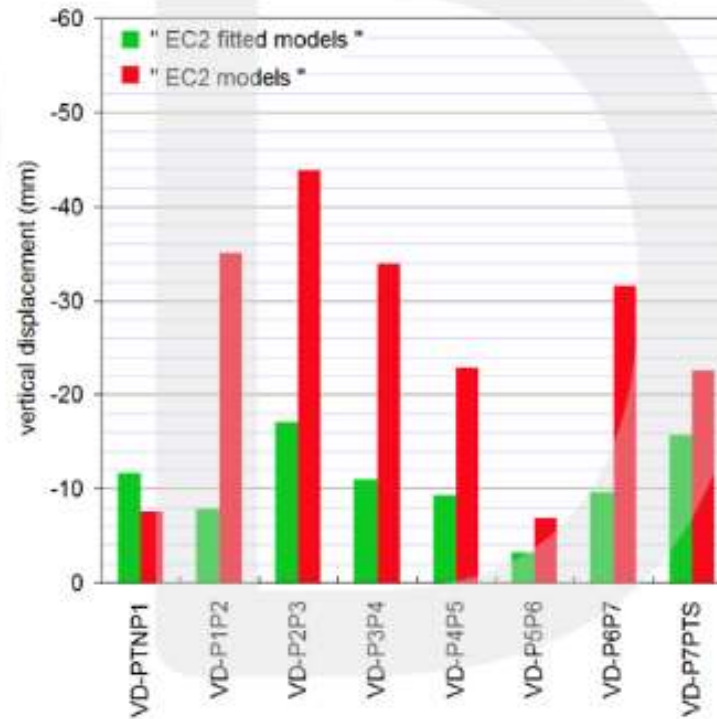

Obs. : deflections and concrete stresses checked

2. The results : Reference values for the measurements in 2030

□ PREDICTIONS FOR THE END OF THE OPERATIONAL LIFE (100 years)

Vertical displacements

2. The results : Reference values for the measurements in 2030

- ❑ PREDICTIONS FOR THE END OF THE OPERATIONAL LIFE (100 years)
Bearing displacements and rotations

2. The results : Reference values for the measurements in 2030

□ PREDICTIONS FOR THE END OF THE OPERATIONAL LIFE (100 years)

Concrete deformations

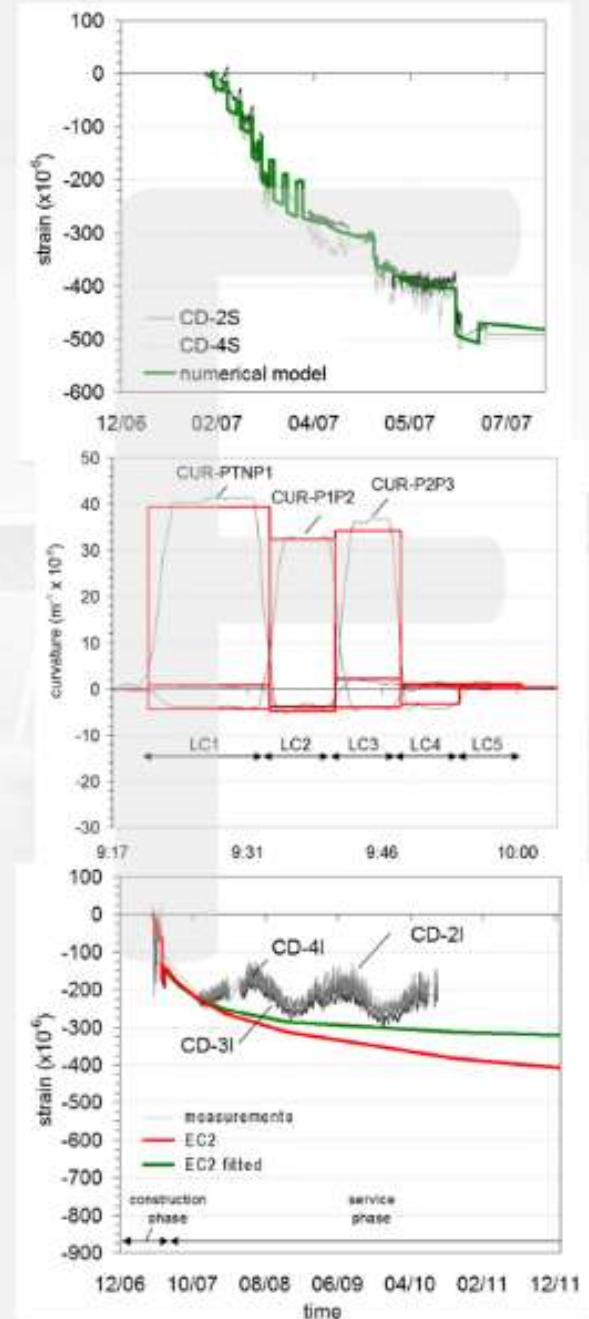

2. The results : Measurements and FE results

CONSTRUCTION

LOAD TEST

OPERATIONAL

2. The results : Measurements and FE results
